

User Guide

Selecting specific countries:

Select either the box select or the lasso select option from the top bar in the map section to select specific countries on the map. We get this top bar on hovering anywhere on the map. After selecting this option, you can click and drag to select the countries of your choice.

Choosing between inflow/outflow:

You can choose inflow if you want to study people migrating to the selected countries. Similarly, you can choose outflow if you want to study people migrating from the selected countries.

Select inflow/outflow

☒ Inflow ☐ Outflow

Identifying “Migrant Hubs”:

When we select more than 2 countries on the map, there is a chance that migrants from these countries can go to the same destination. For the scope of this tool, we will refer to these common destinations as “Migrant Hubs” and these can be identified using the Node-link diagram. User has to keep in mind that only countries which are not included in the selection and have connectivity of more than 1 can be considered migrant hubs.

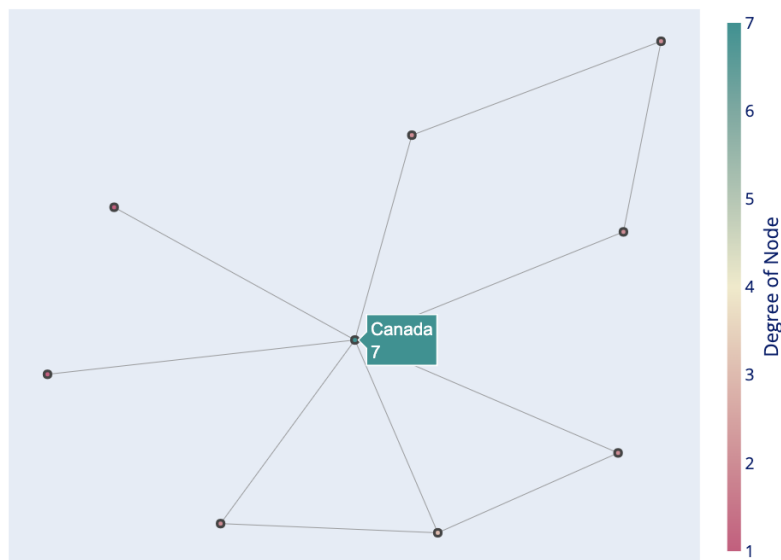

Ex: Here the user-selected countries are Canada, Greenland and Iceland. So these countries cannot be called migrant hubs in this scenario. But other countries which have connectivity of more than 1, are considered migrant hubs (ex: Sweden, Australia, etc).

Select chart:

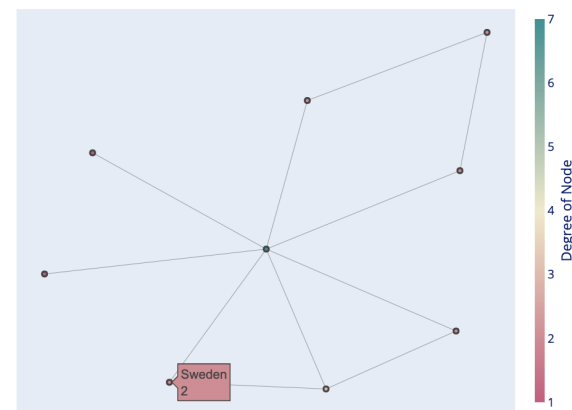

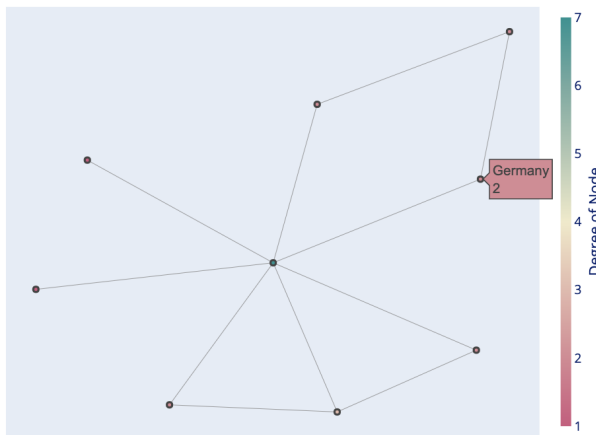

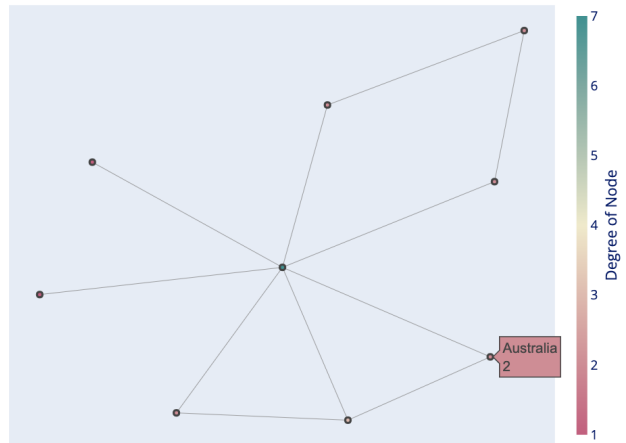

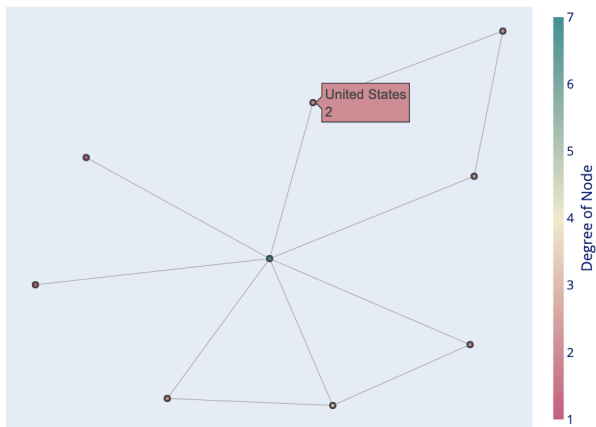

Node-link Diagram

NOTE: If choosing Sankey Diagram, choosing too many countries at a time is not advised here. This is due to exponential increase in visualization complexity.

Connectivity between countries in the year 2010

Migrant hubs:

Non-migrant hubs:
